A wonderful theorem of linear algebra says that the three rows are not independent either.

The third row must lie in the same plane as the first two rows.

Some combination of rows 1 and 2 will produce row 3. You might find that combination quickly (I didn't).

Linear Algebra
Its Applications
(Fourth Edition)

Until the 19th century, linear algebra was introduced through systems of linear equations and matrices. In modern mathematics, the presentation through vector spaces is generally preferred, since it is more synthetic, more general (not limited to the finite-dimensional case), and

The row picture for $T A = I$ has 3 perpendicular planes $x = 2$ and $y = 3$ and $z = 4$. Those are perpendicular to the x and y and z axes: $z = 4$ is a horizontal plane at height 4. The column vectors are $j = (1, 0, 0)$
